

Abstract

There is provided an information processing apparatus with a display device placed on a front thereof in a transferable manner. In the apparatus, pluralities of openings are formed to allow an information recording medium to pass through each of the openings. The apparatus comprises a display device and a transfer unit. The display device displays an operation state of the information processing apparatus and to be transferable in front of the plurality of openings. The transfer unit is configured to control the display device so that the display device is transferred to a position at which the display device masks, of the plurality of openings, another opening other than a particular opening through which an information recording medium in operation is allowed to pass.
